TREADLINE

POINT OF SALE · INVENTORY · CASH CONTROL

The complete tire shop system.

Ring a flat in four taps. Know what's on the rack without walking it. Close the drawer knowing it's right — and knowing who to ask if it isn't.

Your shop already works. It just can't prove it.

Most tire shops run on three things: a cash drawer, a spiral notebook, and one person who remembers everything. That works right up until the morning it doesn't.

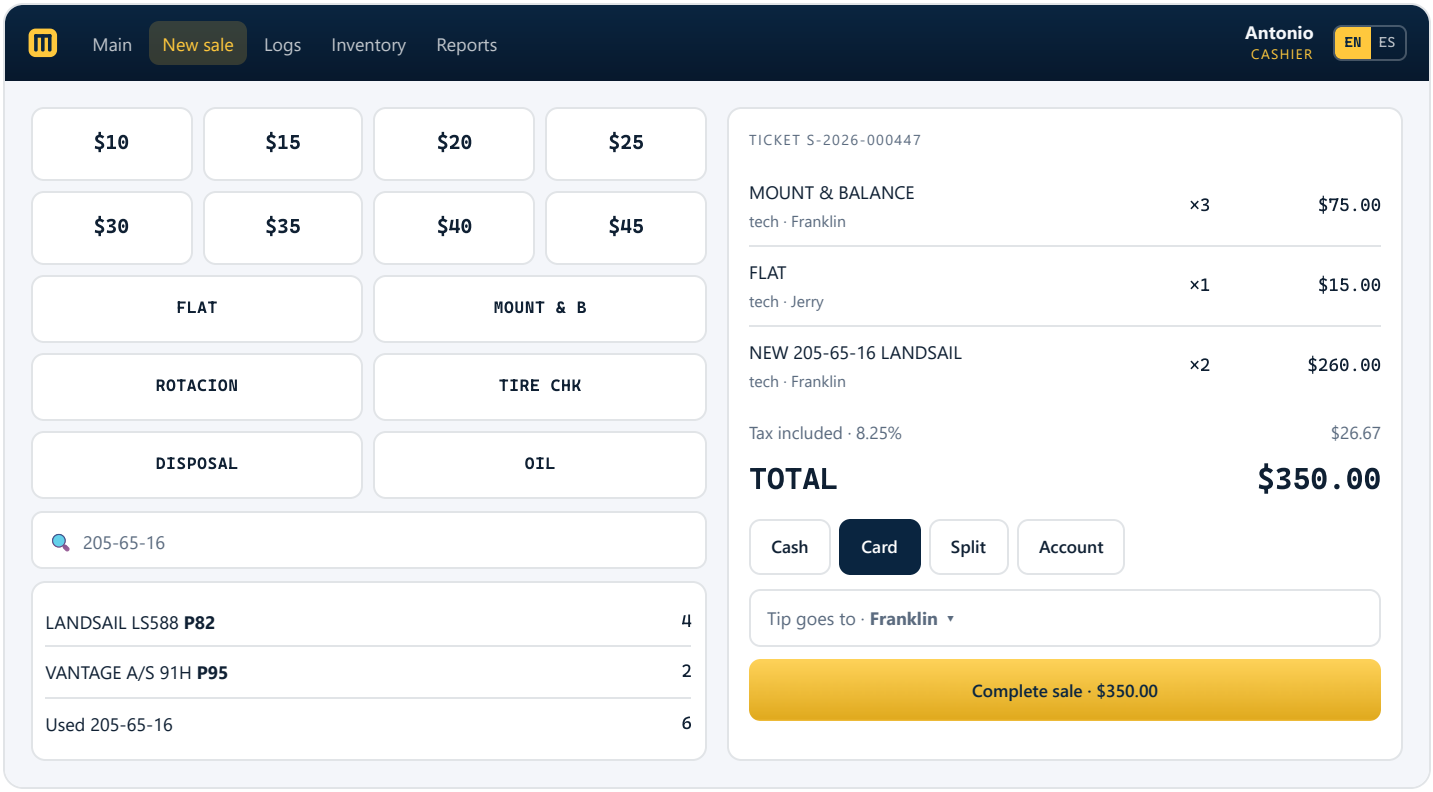

WHAT HAPPENS NOW	WHAT TREADLINE DOES
Handwritten tickets Illegible, lost, or in somebody's back pocket.	**Rung in four taps, kept forever** Searchable by name, phone, plate or tire size. Printed on thermal or letter paper.
"Do we have a 205-65-16?" Somebody walks the racks. Twice. And still guesses.	**A live count on every screen** Type the size however it comes out of your mouth — 205-65-16, 205/65R16, 2056516.
The ordered tire nobody called about Came in Thursday. Sat three weeks. Customer went elsewhere.	**A board with the phone number on the card** Who's owed a call, how long they've waited, and what was said last time.
The drawer is short Nobody knows when, or by how much, or who was on it.	**A blind count, then the verdict** The expected figure stays covered until you've typed yours. A count is a count, not a copy.
Who actually did the work? Payroll from memory, and an argument on Friday.	**Credit sits on the line, not the ticket** Two techs on one job, both paid right. Tips and commission handled at the register.
"How did last month go?" Add up the notebook. Or don't, and hope.	**Margin, movers, dead stock, lost sales** On screen, on paper, in English or Spanish, ready before you've finished your coffee.

Every screen here exists because a shop lost money without it

The close-out was written the week a drawer came up $200 short and nobody could say when. The order board was written after a customer waited three weeks for a tire that was already in the corner. This is not a generic POS with a tire skin on it.

Four taps and the car is moving.

Most tickets in a tire shop are under twenty dollars and take under a minute. A register slower than a notepad has already failed.

The grid is yours

The prices and services this shop rings all day, as buttons. Change them yourself — no support call, no software update.

Search that speaks tire

Any format you'd say out loud. The count is live off the racks, so the answer is the racks' answer.

P82 is your cost, disguised

Your buying floor, on the counter sheet, readable by your staff and meaningless to the customer reading upside down.

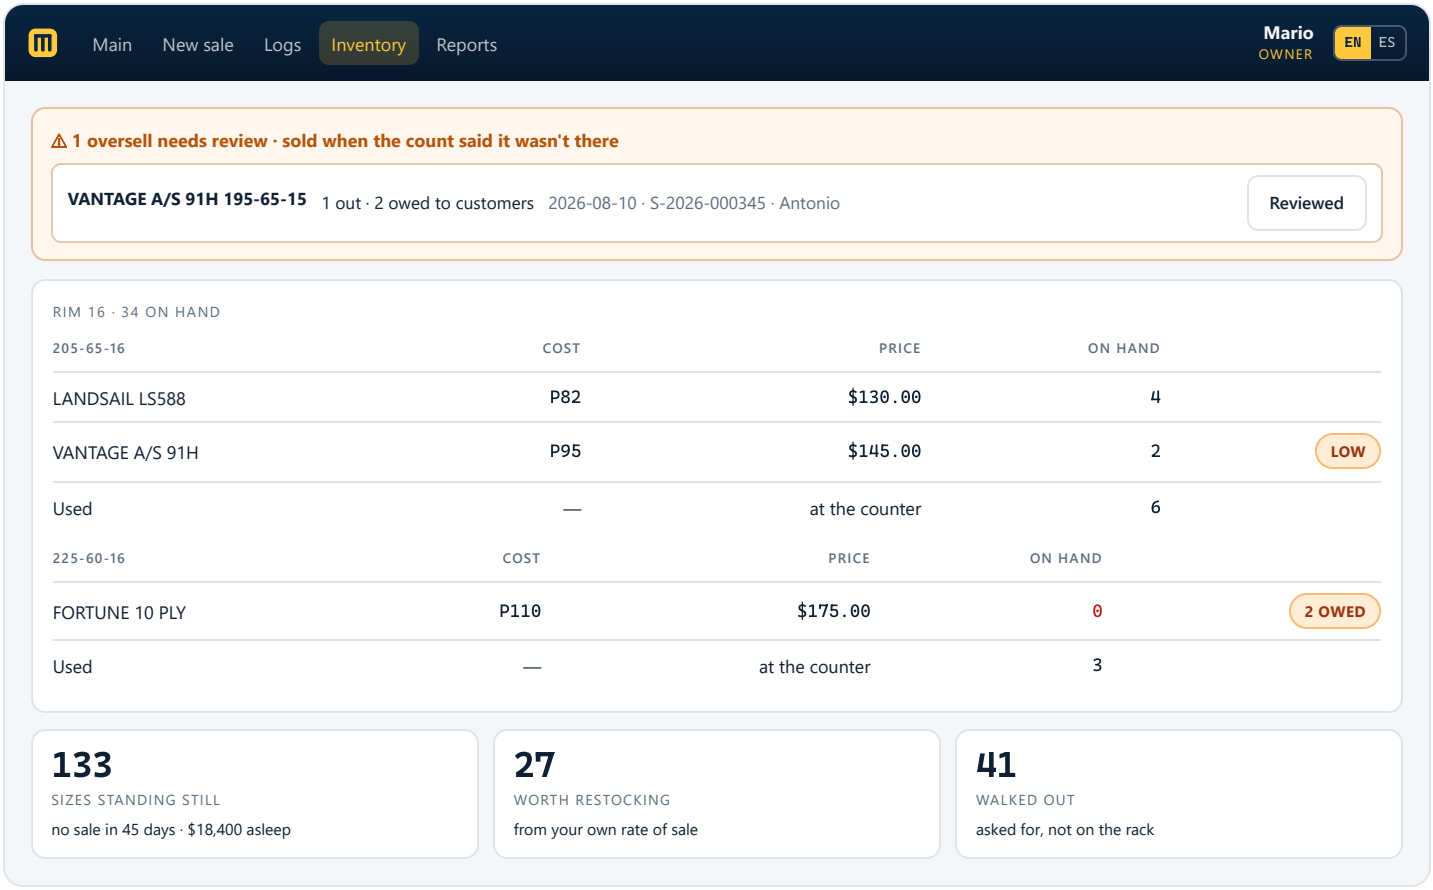

Credit on every line

Franklin mounted, Jerry did the flat. Both are on the ticket, and both are on Friday's numbers.

> ### A tip always has somebody's name on it
>
> Treadline refuses to take a tip credited to nobody. Half cash and half card is one ticket, not two. A tip that turns up a day later is booked against the original ticket, not invented as a phantom sale.

It counts tires. Not "items."

Generic software makes you invent a product for every tire, then treats a used tire and a new one as the same kind of thing. They aren't.

Grouped by rim, like the racks

Somebody counting stock walks one rim at a time. A sheet sorted any other way sends them back and forth all afternoon.

Used collapses to a count

No brand, no model, no cost — a used tire has none. One line: *Used · 6*. Priced at the counter, where it's decided.

Oversells surface, they don't hide

You sold two you didn't have. The sale went through — the customer was standing there — and the row sits at the top until a manager reviews it.

Press a tire for its whole life

Every receive, sale, void and count, with the ticket number and who did it. "Where did the other six go" has an answer.

Three questions no notebook can answer

What's asleep?

Sizes with your money in them and no sale in 45, 90 or 120 days.

What should I order?

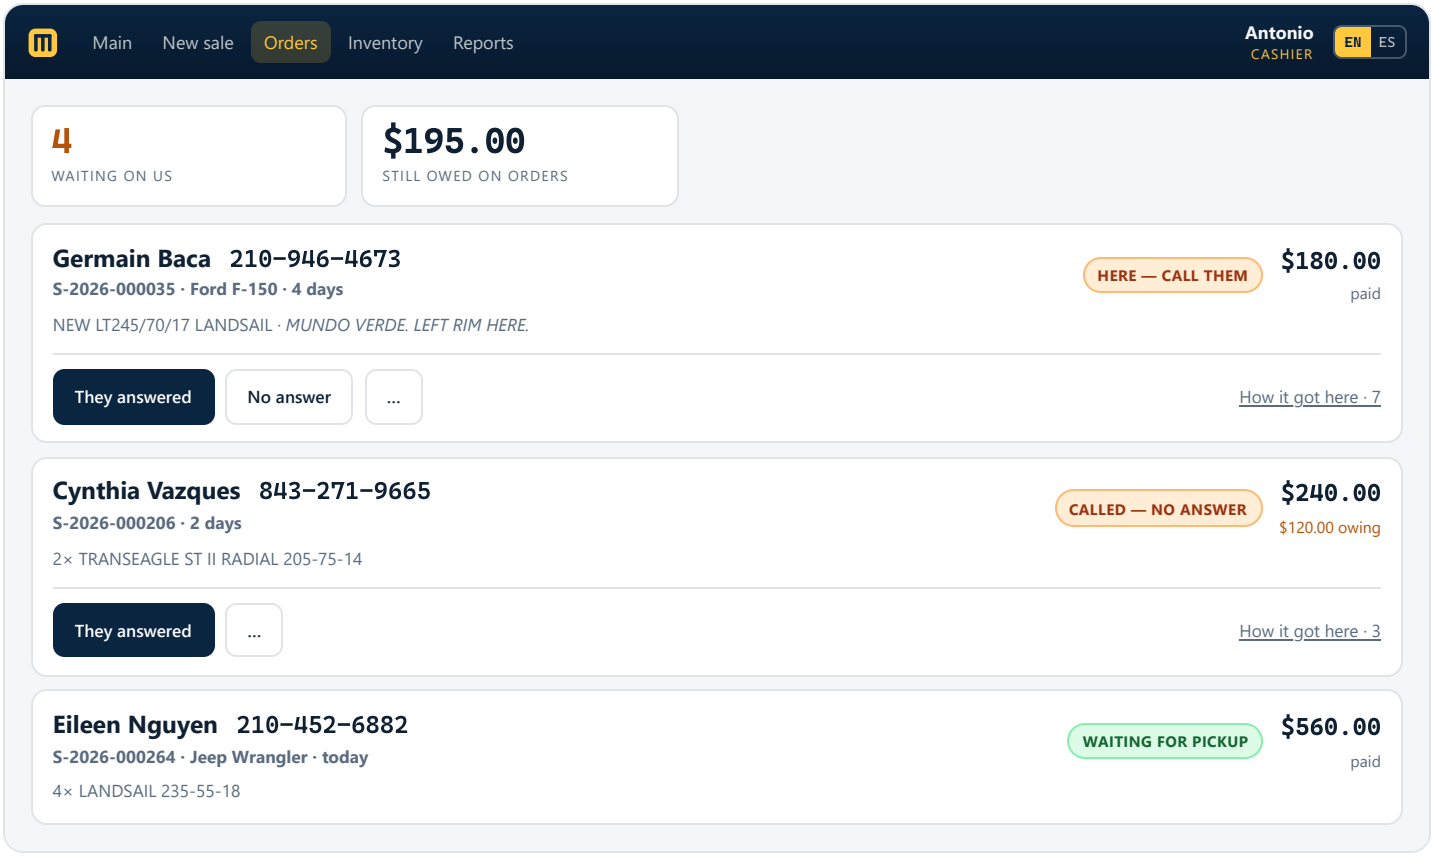

Levels worked out from your own rate of sale — and editable, because you know things the numbers don't.

What did I turn away?

Every size a customer asked for that wasn't on the rack.

The tire that came in on Thursday.

Ordered Monday. Arrived Thursday. Nobody called. The customer rings the following Tuesday, angry. This is the job that reliably falls through — so it gets a board.

The customer is the headline

Every stage on this board is a version of *somebody has to ring this person*. The name and number come first; the ticket number is there, one size down.

The stage is a colour

Orange means the shop owes a call. Green means it's the customer's turn and nothing here can hurry it.

Two answers, not "next"

A phone call has two outcomes. Both are on the card, worded as what happened — and the good one is the one that looks like the button.

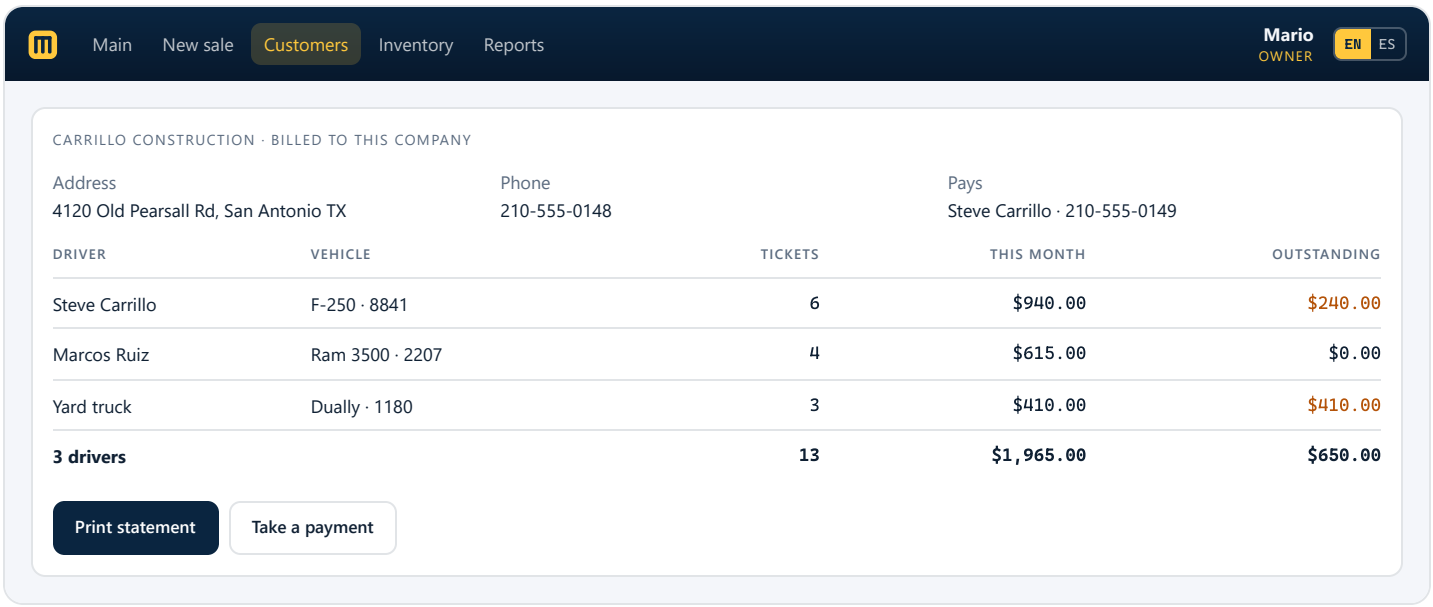

Confirm, and undo

Every move names the customer before it happens, and can be taken back. Four near-identical cards is exactly where the wrong row gets pressed.

> ### "Nobody ever called me" — answered with a date
>
> *How it got here* opens the whole life of the order: ordered when, arrived when, who rang, and how many days it sat at each stage while somebody's customer waited. Read from the beginning, because it's a story.

The company that sends you eleven trucks.

Fleet work is the best money in the shop and the worst paperwork. Treadline bills the company for every driver who comes in, and prints one statement.

One company, many drivers

Each driver is a customer in their own right, with their own history and their own truck. The money rolls up to the company.

A tab has to be collectable

Treadline refuses a charge on account without a name and a number attached. An unnamed tab is money you've given away.

The statement prints

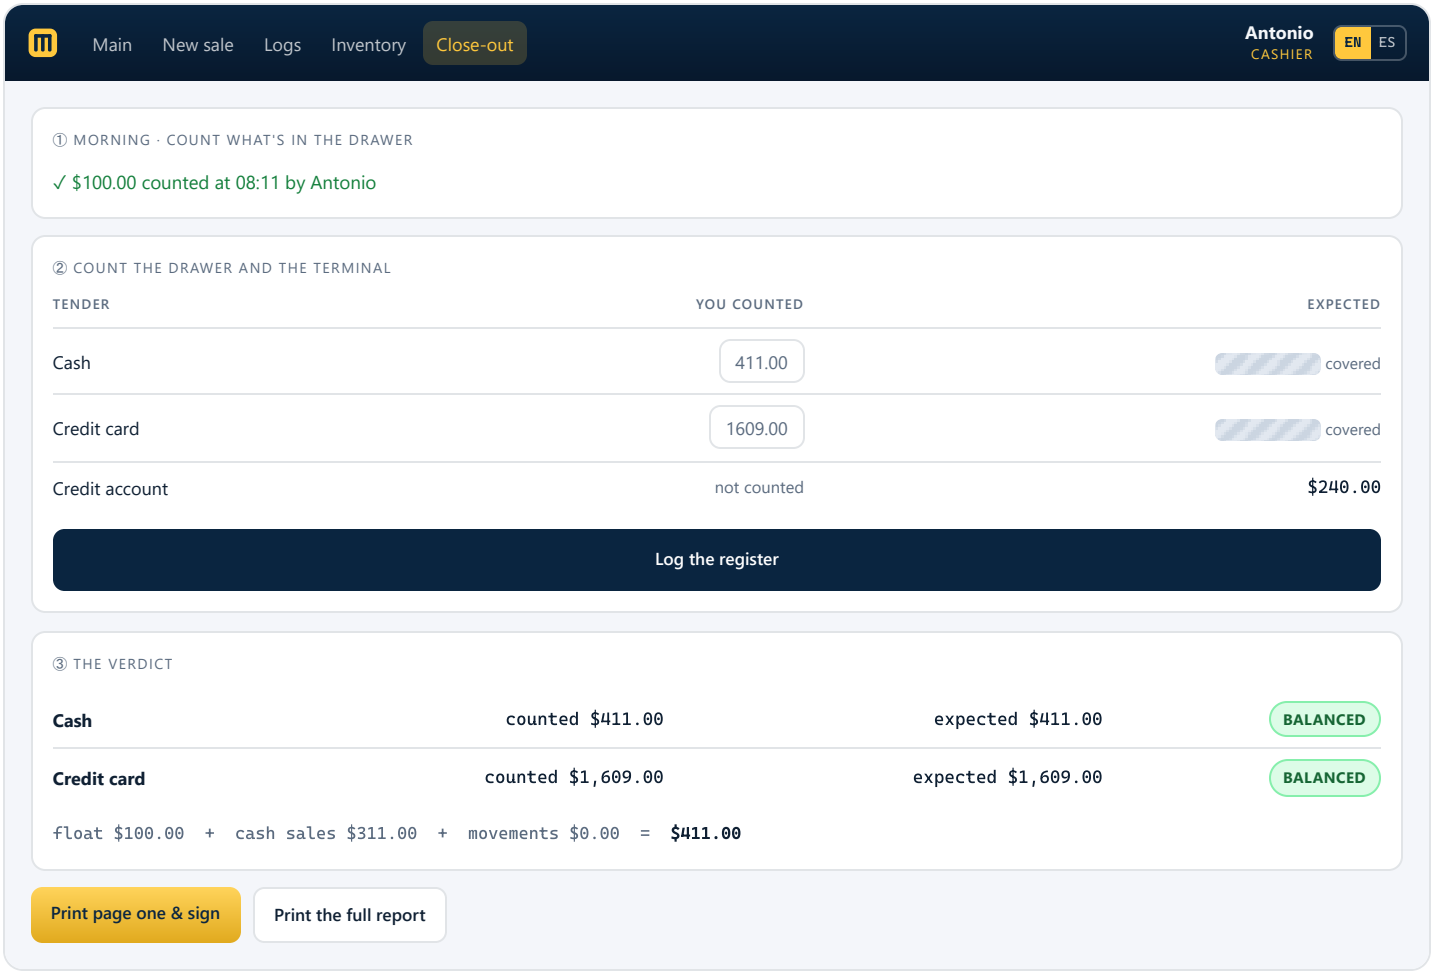

On letterhead, itemised by driver and vehicle, ready for accounts payable — not a screenshot of a screen.

Every ticket remembers the car

When the same F-250 comes back with a vibration, the counter can see you balanced it in March.

The screen that pays for the software.

At the end of every day somebody counts the drawer. Treadline is what makes that count mean something.

Blind, and blind per tender

The expected figure stays covered until you've typed *that* tender's count. Type the card total and the cash figure stays hidden. The owner can skip the cover; nobody else can.

It stops the mistake happening

Try to cash in exactly the float first thing in the morning and it stops you: *the drawer already carries the float — entering it here counts the same money twice.*

Page one is the product

The verdict, the reconciliation, the tips line and two signatures. That's the sheet that goes in the folder. Everything else prints behind it.

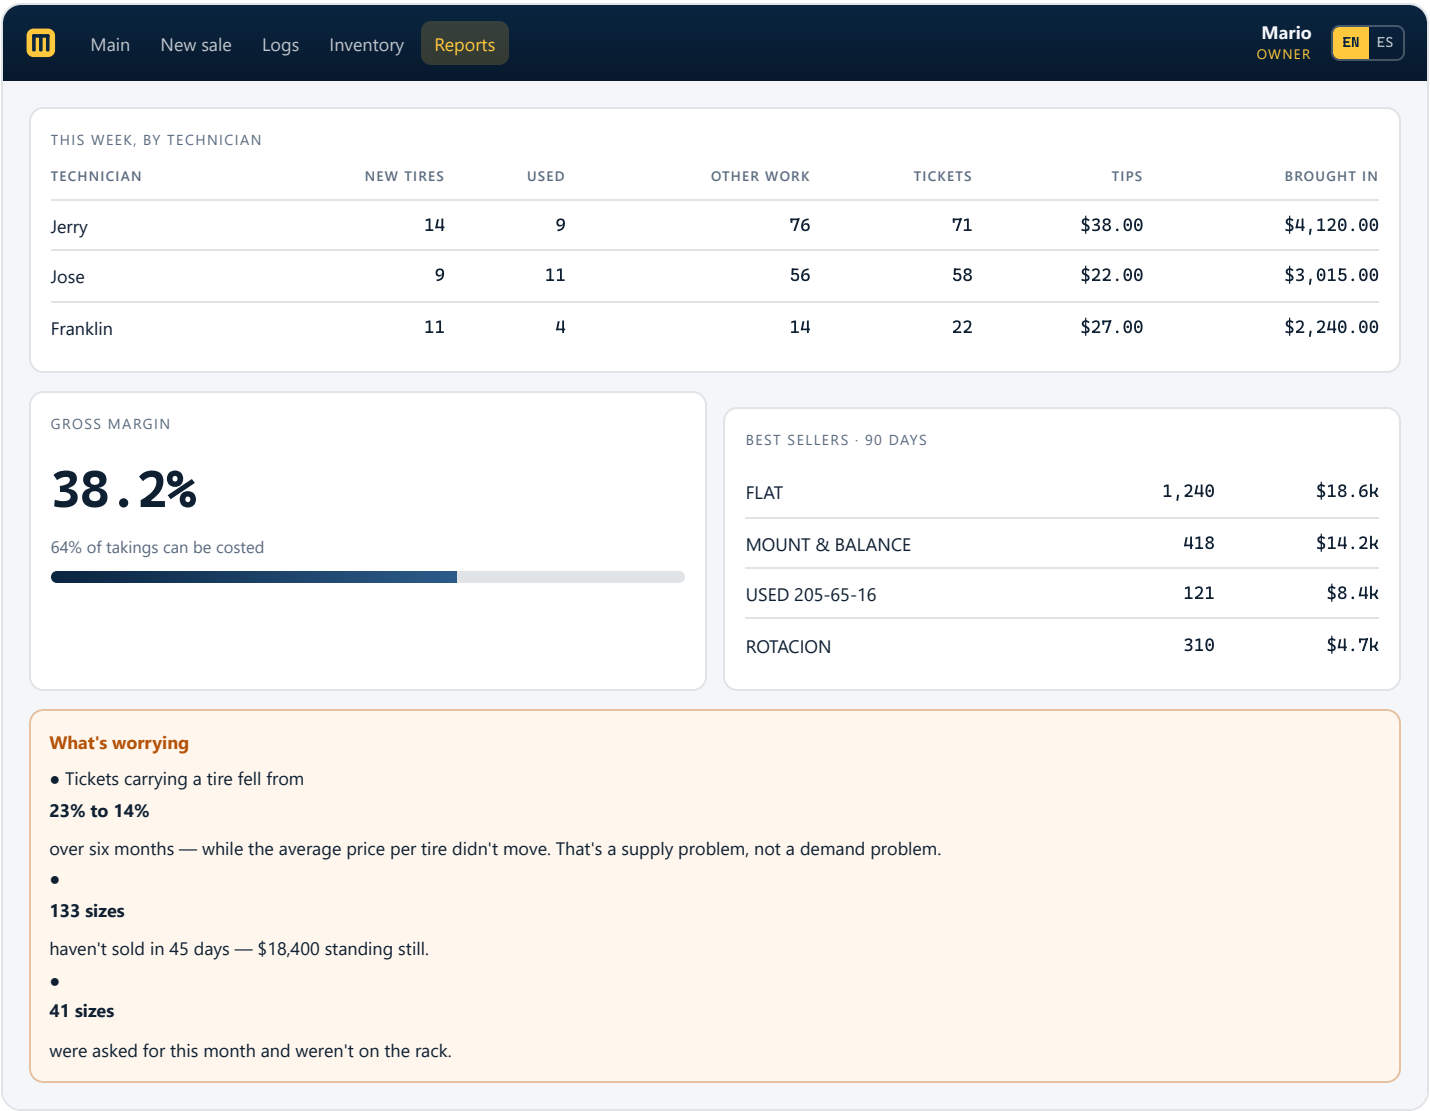

The card batch is never wrong

Treadline treats the terminal as ground truth and the register as the suspect — so a mistyped tender shows up as a mismatch instead of hiding in a net that happens to balance.

> ### Why "covered" matters more than it sounds
>
> A count you can see the answer to is not a count — it's a copy. Every shop that has ever been quietly skimmed was skimmed by somebody who could see the number they were supposed to hit before they counted.

Friday's payroll, settled on Wednesday.

Not a wall of charts. The handful of numbers that change what you do this week — and the sentences that say what they mean.

Nothing is ever deleted

A void writes a reversing entry; it doesn't erase the original. A refund is its own row. The books can't be quietly rewritten — by anyone, including the owner.

Every change is signed

Who voided it, who discounted it, who moved the stock, who took cash out of the drawer — with a timestamp and a reason, permanently.

The alarm log remembers

Every exception the system has raised, who waved it away, when, and what they wrote. Dismissing an alarm doesn't silence it — it signs it.

Payroll weeks freeze

Once a week is paid it's locked. A correction made in August books into August, instead of quietly rewriting a July payout you've already handed out.

It tells you what's wrong, not just what happened

Most reporting hands you a chart and wishes you luck. Treadline reads your own numbers and writes the sentence: *tire attachment fell nine points while the price per tire held flat — you're not losing customers, you're running out of stock.*

Everything else.

THE BRAND

Treadline — the tread on the tire, and the line at the bottom of the page. The mark is a contact patch: a rounded square with three grooves cut through it, the middle groove extending to form the crossbar of a **T**. One colour, no gradient, legible at 16px on a browser tab and at three feet on a shop wall.

Ink Navy	Deep	Signal Amber	Chalk	Slate	Torque Red
#0A2540	#07182C	#FFC83D	#F4F6FA	#5B6B7F	#B91C1C

Amber is the only loud colour and it's spent on one thing: *something needs a person*. Red is reserved for money that doesn't balance and appears nowhere else — not on a heading, not on a border, never as decoration. Everything else stays quiet so those two mean something.

WHAT IT COSTS

Counter

ONE REGISTER · UP TO 5 STAFF

- Register & receipts
- Inventory
- Close-out
- Daily report

$___ /mo

Shop

★ MOST SHOPS · UP TO 20 STAFF

- Everything in Counter
- Special orders board
- Fleet accounts & statements
- Full reports & trends
- Alarm log
- Time clock

$___ /mo

Multi-bay

MORE THAN ONE LOCATION

- Everything in Shop
- Stock across locations
- Group reporting
- Priority support

$___ /mo

Every plan: setup and import from your current spreadsheet · training for your counter staff · English and Spanish throughout · every report printable · your data exportable, always. No contract, and no hardware to buy — it runs on the computer you already have with the printer you already own.

GETTING STARTED

WEEK ONE

We import your tire list, your customers and your prices. You keep working exactly as you are.

WEEK TWO

Ring alongside your current method for a week. Nothing at risk, and you can compare the totals yourself every night.

WEEK THREE

The notebook goes in the drawer. Within a few days you stop opening it.

[Customer quote — to be filled]

Reserved for a real quote from a real shop once the first customers are live. Do not print invented praise: a tire shop owner can smell it, and it costs more trust than it buys.

SEE IT RUNNING IN YOUR OWN SHOP

We'll bring a laptop, ring your next twenty tickets on it, and leave.
If it isn't faster than what you do now, we'll tell you so ourselves.
