STAFF MANUAL

Shop System

How to take money, how to close the day, and what to do when something goes wrong

Casias Muffler and Tire Shop · San Antonio, Texas
For all staff · August 2026

HOW TO READ THIS

A box like **New sale** is the exact text on a button; look for it as written. The grey slabs are **pieces of the screen**, not controls on this page — they cannot be pressed. And after every action there is a note saying **what just happened**.

32 The three rules

33 Company accounts (fleets)

01 Signing in and out

1. **Tap your name** in the list. Do not type anything yet.
2. Type your four-digit **PIN**.

> **WHAT JUST HAPPENED**
>
> The system now knows who you are. From this moment **everything you do carries your name**: every ticket, every payment, every correction. That is not there to watch you — it is what lets you prove you did not do something.

When you step away

Press **Switch user** at the top right. If nobody touches the machine for a while it locks itself.

> **NEVER LEND YOUR PIN**
>
> If somebody else uses your account, what they do is written down under **your** name, and there is no way to separate it afterwards. If you think somebody has learned it, ask for it to be changed the same day.

02 How the screen is laid out

Before anything else: there is a row of tabs along the top. That row never changes. Everything else on screen changes depending on which tab you are in.

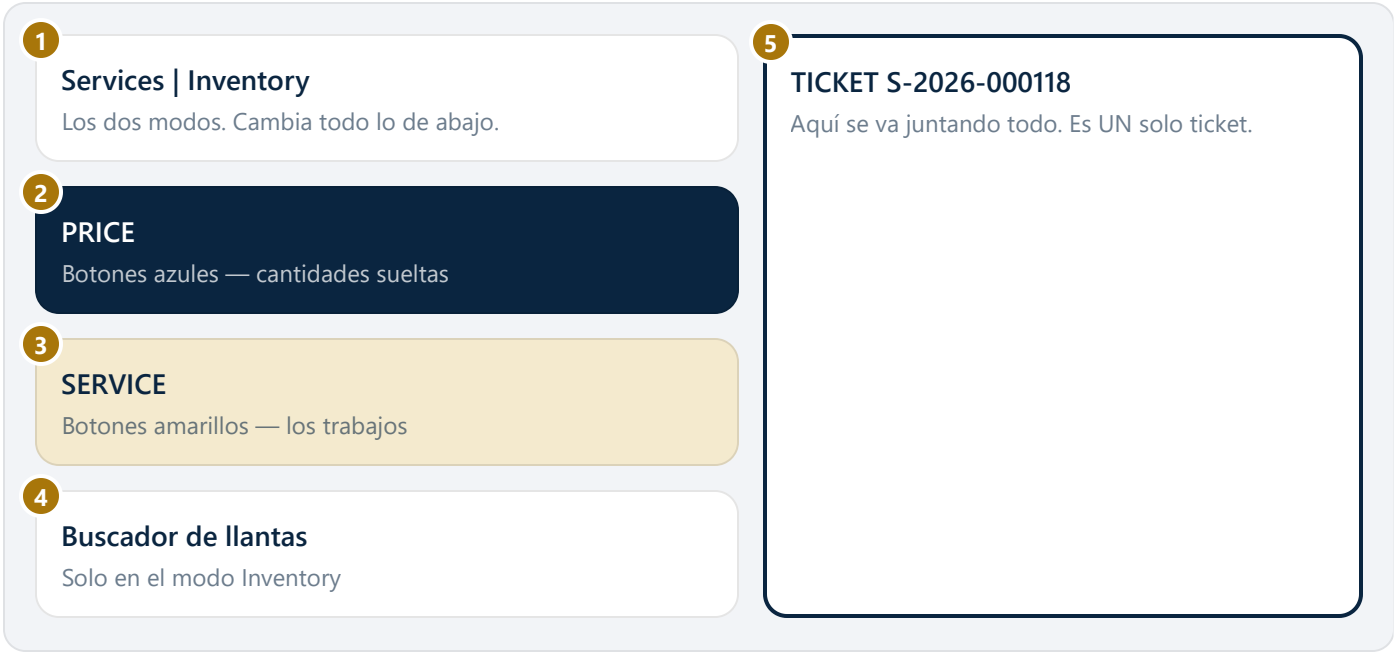

The **white** tab is where you are. The others are pale. If you are not sure where you are, look for the white one.

TAB	WHAT IS IN IT
Main	The day's summary and the two lists of things outstanding.
New sale	Where a ticket is built and money is taken.
Logs	Look up any ticket, today's or older.
Inventory	What tires are on the racks and at what price.
Close-out	Count the money and close.

> **IF YOU GET LOST**
>
> Press **Main**. Always. Everything is reachable from there and pressing that tab cannot break anything.

03 The sale screen, part by part

Press **New sale**. Before touching anything else, look at how the screen is split. There are **two sides**, and they do different things:

#	WHAT IT IS	WHAT IT DOES
1	**Services | Inventory**	The two modes. **Services** for work, **Inventory** for anything that comes off a shelf — tires, batteries, sensors. Switching modes changes everything below.
2	**PRICE** (navy)	Loose amounts. Services mode only.
3	**SERVICE** (amber)	The shop's jobs, with their names and prices. Services mode only.
4	The search box	Appears in Inventory mode. This is where the size is typed.
5	**TICKET** (right)	The ticket you are building. **It stays there the whole time** while you add things from the left.

> **THE ONE THING TO HOLD ON TO**
>
> The left side **adds**. The right side **is the ticket**. Everything you press on the left drops onto the right, on the same ticket, until you charge it. You are not starting a new ticket each time you press a button.

THE TICKET NUMBER

The top of the right side says **TICKET** and a number, for example *S-2026-000118*. That number does not change while you are building that ticket. If it changes, you started a different one.

04 Two tires on one ticket

A ticket is **not one thing**. It is a list. One ticket holds every tire and every job done to a car, and at the end it is charged **once**.

ASÍ — UN TICKET

VANTAGE 225-50-17 2 × $130.00 · Kevin	$260.00
MOUNT & B 2 × $10.00 · Kevin	$20.00
Total	**$280.00**

ASÍ NO — DOS TICKETS

TICKET S-2026-000118 — $140.00

TICKET S-2026-000119 — $140.00

Dos recibos, dos cobros, y el cliente se lleva dos papeles por un solo trabajo.

How to put two of the same tire on

1. In **Inventory** mode, search the size and tap the tire. It is **not added yet** — it just loads, with its price.
2. In the small box on the right — the how-many box — **clear the 1 and type 2**.
3. Pick who fitted it.
4. Press **Add**. **Only now** does it go on the ticket.

WHAT JUST HAPPENED

The line reads **2 ×** with its price already multiplied. The Total below too. It is still **one** ticket with **one** line — that line just counts for two tires, and stock will take two off.

THE QUANTITY GOES IN BEFORE ADD

That is the order, and it does not work the other way round from here: search, set how many, **then** Add. If it is already on with the wrong quantity, fix it from the ticket on the right by tapping the line and using **How many**.

And if they are two different sizes

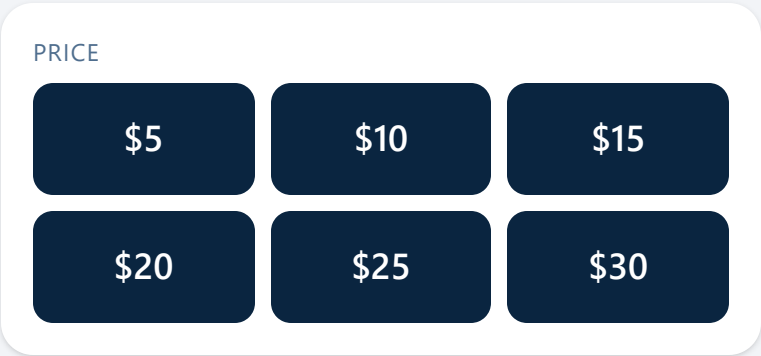

The same: search the first, set how many, **Add**. Then search the second, set how many, **Add**. That leaves **two lines on the same ticket**. Nothing needs closing in between.

> **NEVER MAKE TWO TICKETS FOR ONE CAR**
>
> It is the costliest mistake to unpick. Two tickets means two receipts, two payments and having the same conversation with the customer twice — and if one gets paid and the other does not, one of them sits in **Pending** for ever with nobody knowing why.
>
> One car, one visit, **one ticket**. Even if it is four tires, mounting, balancing and a disposal.

05 Building a ticket, step by step

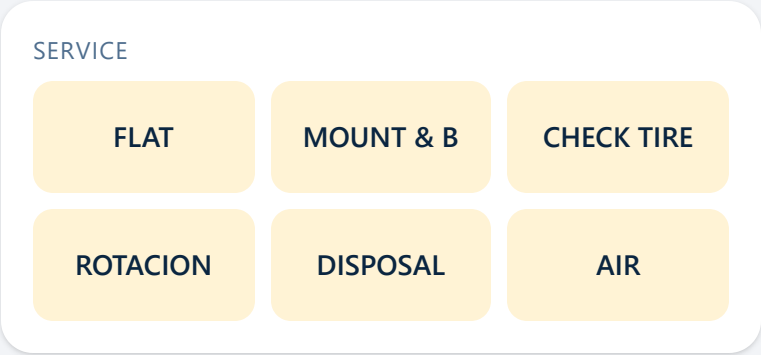

Press **New sale**. The screen splits in two: buttons for adding things on the left, the ticket you are building on the right.

The price buttons (navy)

These are loose amounts. They are for charging something with no name of its own: a favour, a quick charge, whatever was agreed with the customer. Tap one and that amount goes on the ticket.

The service buttons (amber)

These are the shop's jobs, each with its price already set. One tap adds the job **with its name**, which is why they report properly: the system knows it was a **FLAT** and not "twenty dollars".

> **NAVY AND AMBER ARE NOT THE SAME**
>
> If the job has an amber button, **use the amber one**, even when you know the price. Ringing a FLAT on the navy $16 button gives the customer the same total and takes away the shop's only way of knowing how many flats it did that month.

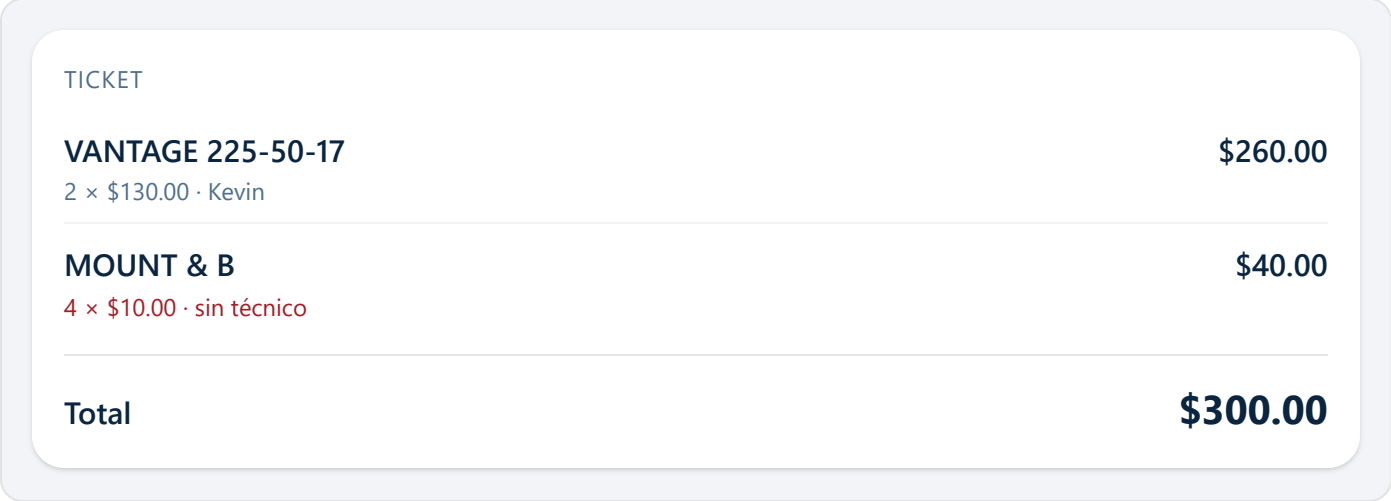

Adding a tire

1. Type the size in the search box — for example *205 60 16*. No dashes or R needed.
2. The list of what is on the racks appears. Each says how many are left.
3. Tap the one you are selling. It loads with its price, **but is not on the ticket yet**.
4. Set how many and who fitted it, then press **Add**.

> **WHAT JUST HAPPENED**
>
> The tire went onto the ticket on the right. It has **not left the racks yet** — that happens when the ticket is paid or closed. If you picked the wrong one, take it off and nothing has happened.

06 The ticket on the right

Everything you add shows as a line. It looks like this:

Top, in dark type: what it is.

Below, in grey: how many, at what price, and **who did it**.

On the right: what that line comes to.

At the bottom: the ticket **Total**.

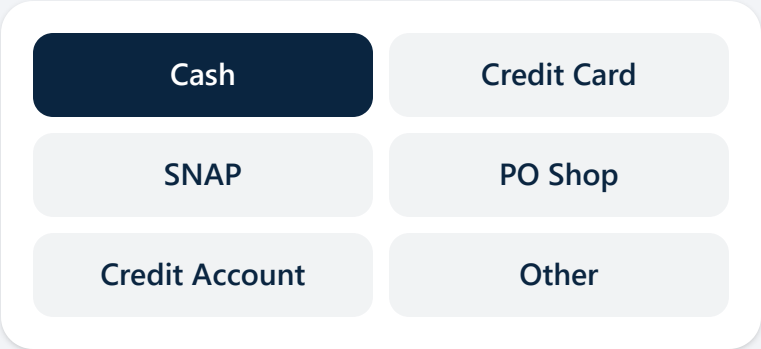

> **THE LINE WITH NO TECHNICIAN**
>
> In the example above the second line reads **sin técnico** in red. That is a line nobody has been put on. It can still be charged, but the work counts for nobody: it does not reach the wall board and it does not count towards tips. Name the technician before you charge.

Changing a line

TO	DO THIS	WHAT HAPPENS
Change the quantity	Tap the line and use **How many**	The line and the Total recalculate themselves.
Change the price	**Change the price**	The change is recorded and appears on the night's close-out.
Remove the line	Tap the line and remove it	It goes. Before the ticket is charged, it leaves no trace.
Set the technician	Tap the line and pick the name	The name appears in grey under the line.

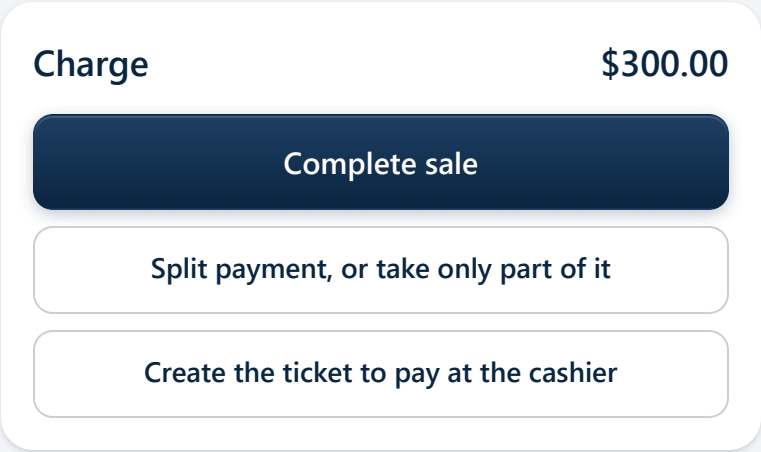

07 Taking the money

Once the ticket is complete, pick **how the customer is paying**. The tender buttons look like this:

BUTTON	WHEN TO USE IT
Cash	Notes and coin.
Credit Card	A card on the terminal.
SNAP	Financing. The customer takes the tires and pays the finance company, not the shop.
PO Shop	Purchase order.
Credit Account	Charged to the customer's account. **No money arrives today.**
Other	Anything else.

The three ways a ticket can end

1. **Complete sale** — the solid navy button. The customer paid it all. This is the ordinary case.
2. **Split payment** — they paid with two things, or paid only part of it.
3. **Create the ticket to pay at the cashier** — nothing collected yet.

> **WHICH ONE TO PRESS**
>
> If the customer is handing you the whole amount right now, it is the **solid navy** one. The other two are outlined rather than filled, precisely so they cannot be mistaken for the ordinary case.

08 When they pay two ways

Example: the ticket is $300 and the customer gives $100 cash and the rest on a card.

1. Press **Split payment, or take only part of it**.
2. Pick **Cash** and type **100**.
3. Pick the second tender. The system has already filled in what is left.
4. Press **Take both charges**.

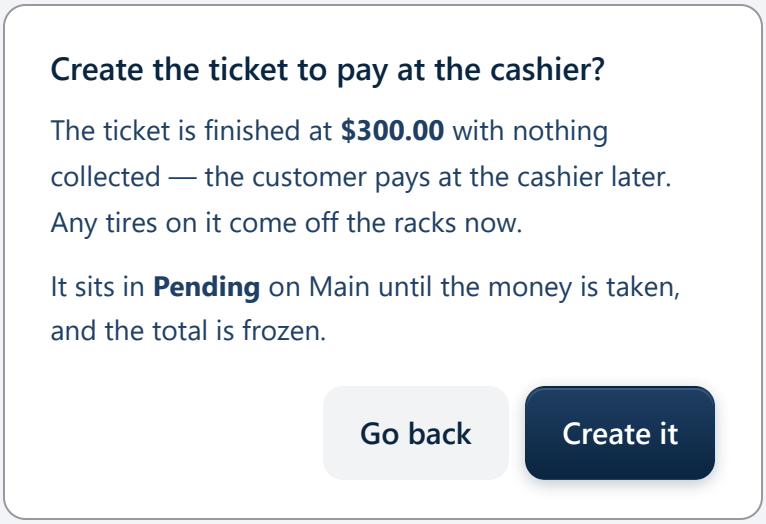

> **WHAT JUST HAPPENED**
>
> **Two payments** were recorded against the one ticket, and the ticket closed. On the night's count $100 shows under cash and $200 under card — which is exactly what will be in the drawer and on the terminal.

If they only pay part

The same, but enter only what they handed over and stop there. The ticket keeps a **balance** and appears under **Pending** on `Main` until the rest is paid.

09 Closing without taking money

For when the work is written up outside and the customer pays indoors. Pressing that button brings up this box:

Read it. It is not there for decoration: it states the two things that happen the moment you press **Create it**.

The tires leave the racks now. Stock has already taken them off, even though nobody has paid.

The total freezes. The price can no longer be changed.

> **WHAT JUST HAPPENED**
>
> The ticket closed with no money and went to the **red** box on **Main**, the one headed **Pending**. It stays there until somebody takes the money. If nobody does today, it will still be there tomorrow.

> **[[GO BACK]] BREAKS NOTHING**
>
> If you are not sure, press **Go back**. The ticket stays exactly as it was and nothing is recorded. The grey button is always the one that does nothing.

10 The two boxes on Main

This is the costliest confusion in the system, so slowly. **Main** has two coloured boxes and they are **not the same thing**.

⏳ PENDING — 2 TICKETS
S-2026-000145 · Marisol Cantú
$53.00

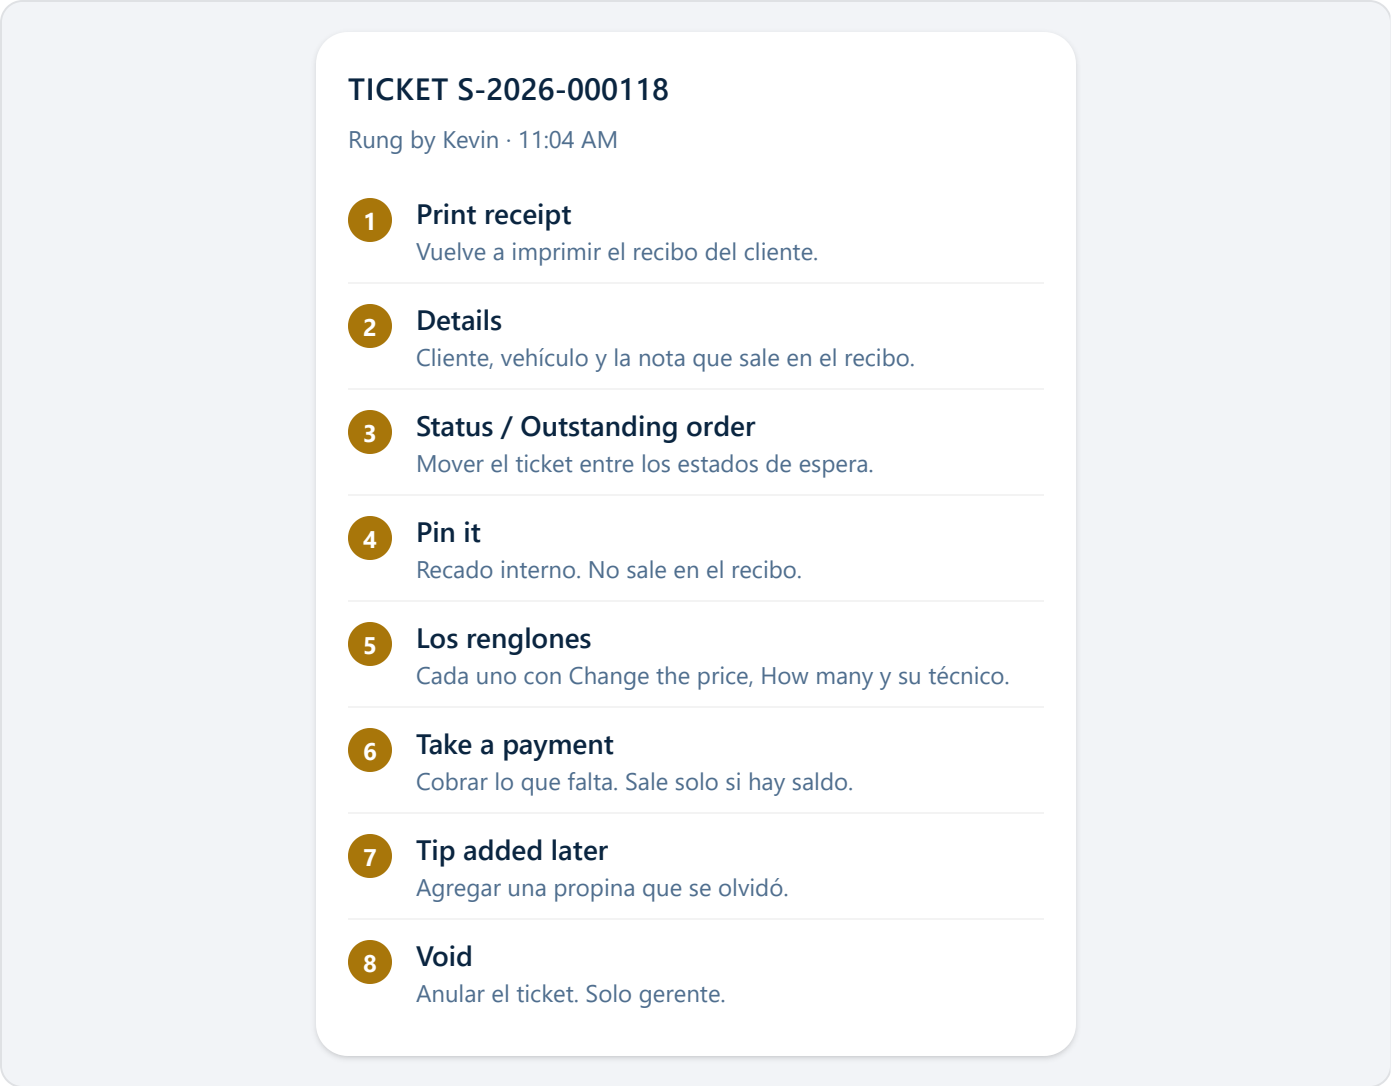

⚠️ OUTSTANDING — 1 TICKET
S-2026-000144 · Aurelio Peña
Ordered

	RED — PENDING	AMBER — OUTSTANDING
What it is	Work done that nobody has paid for.	Tickets we ourselves sent to wait.
Why it is there	Because the money is missing.	Because the tire is missing, or the customer is.
What to do	Take the money.	Ring the customer and move the status.
How it got there	On its own, when a ticket closed unpaid.	Somebody put it there deliberately.

> **A TICKET NEVER MOVES BETWEEN THEM ON ITS OWN**
>
> If a ticket is in **Outstanding**, somebody put it there. Taking part payment does **not** move it to the other box. They answer two different questions: one is "who owes us", the other is "who is still waiting on a tire".

11 The ticket drawer

Tapping a ticket number — on **Main** or in **Logs** — slides a panel in from the right. That is **the ticket drawer**, and it is where everything that can be done to a closed ticket is done.

#	WHAT IT DOES	WHO
1 · Print receipt	Prints the customer's receipt again. As many times as needed.	Anyone
2 · Details	Customer, vehicle and the job note. **This note does print** on the receipt.	Cashier
3 · Status	Move the ticket through the waiting statuses — see the orders section.	Cashier
4 · Pin it	A note for whoever is next. **Does not print**; it stays inside.	Anyone
5 · The lines	Each line carries **Change the price**, **How many** and who it credits.	See below

#	WHAT IT DOES	WHO
6 · Take a payment	Take what is owed. **Only appears if the ticket owes something.**	Cashier
7 · Tip added later	Add a tip that was missed, even from yesterday.	Cashier
8 · Void	Void the whole ticket. It asks for a reason.	Manager

The two notes are not the same

Details → the job note. It **prints** on the customer's receipt.

Pin it → the yellow note. It **does not print**; it is for staff.

> **MIND WHICH ONE YOU WRITE IN**
>
> Whatever goes in **Details** leaves with the customer on paper. If it is a message for a workmate — "would not pay today", "call his wife" — it goes in **Pin it**, never in Details.

Correcting a line already charged

Tap the line inside the drawer. **Fix a price that was rung wrong** appears there. It **deletes nothing**: it keeps the old price, the new one, who changed it and when, and the change appears on that night's close-out.

> **IF THE DRAWER IS MISSING A BUTTON**
>
> It is your role, not the ticket. Voiding and correcting charged prices are a manager's. Ask for it — do not look for another way round.

12 Sold versus Collected

At the top of **Close-out** there are four figures:

WHAT THE REGISTER SAYS

SOLD	TIPS	TERMINAL TAX	COLLECTED
$2,791.00	$64.00	$13.00	$2,842.00
48 tickets	to technicians	on tips taken out	what came in, not what was rung

FIGURE	EXACTLY WHAT IT IS
Sold	What we **charged for today's work**. The sum of the tickets rung today.
Tips	The technicians' tips.
Terminal tax	What the terminal charges for paying tips out.
Collected	The **money that came in today**, wherever it came from.

Why they are almost never the same

Because they measure different things, and the gap runs both ways:

Money came in that was not rung today: somebody came in to settle last week's ticket. That money is in **Collected**, but the work was another day's, so it is not in **Sold**.

Work was rung that brought no money today: a ticket that went to Pending, or one charged to an account. It is in **Sold**, but not a cent of it is in **Collected**.

Tips also land in **Collected**, and they are not the shop's sale.

> **THE SHORT RULE**
>
> **Sold** = what we charged for working. **Collected** = what came into the till. To reconcile the night's money the one that matters is **Collected**, because that is the one you can count with your hands.

13 The close-out

Done in **Close-out**, and the order matters.

1. **Count first.** Take the money out of the drawer and count it. Type what you counted, and each terminal's figure.
2. The system **will not show you** what it expects until you have typed. That is deliberate.
3. Once you have typed, the difference column appears.
4. Settle the card batch on the terminal and mark it here.
5. **Print and sign.**

> **WHY THE COUNT IS BLIND**
>
> If the system showed you the expected figure first, counting would stop being counting and become looking for that number. Covered, the count is a real one. It is not distrust: it is the only way the figure means anything.

If it does not balance

> **DOES NOT BALANCE** — out by $0.00 across tenders, netting to zero overall. Cash −$60.00 · Credit card +$60.00 — possible tender mix-up, see above.

That black box prints on the sheet. It says how much was over or short, and on which tender. When cash is short by exactly what card is over, it is nearly always one sale rung on the wrong button — and the system even names the tickets it might have been.

> **NEVER FORCE THE COUNT**
>
> If money is missing, **enter what you actually counted** and print it that way. The sheet is a record of what happened, not of what anybody wanted. A tidied number looks fine that night and cannot be explained three weeks later.

14 The sheet that comes out

The close-out prints **three sheets**, and each is for a different thing. It is worth knowing which is which, because the first gets signed and the other two get read.

Sheet 1 — the one you sign

It looks the same every night. The day's figures — sold, tips, collected — the two week charts, staff performance, the count by tender, and the ruled signature lines at the foot.

> **WHY THE SIGNATURE IS ALWAYS AT THE FOOT**
>
> So a missing page shows. If the signature comes out halfway down, or on the second sheet, something printed wrong — and that sheet is the one that gets filed.

Sheet 2 — Financial Report

The sheet of things to look at. It opens with **the warnings** — all of them together, at the top — then drawer movements, the midday counts, who went on account, who took what, and prices changed at the counter.

Sheet 3 — Logs Report

The detail. What is owed, what to reorder, the tires that went out, what arrived from the supplier, and every movement of the day in the order it happened.

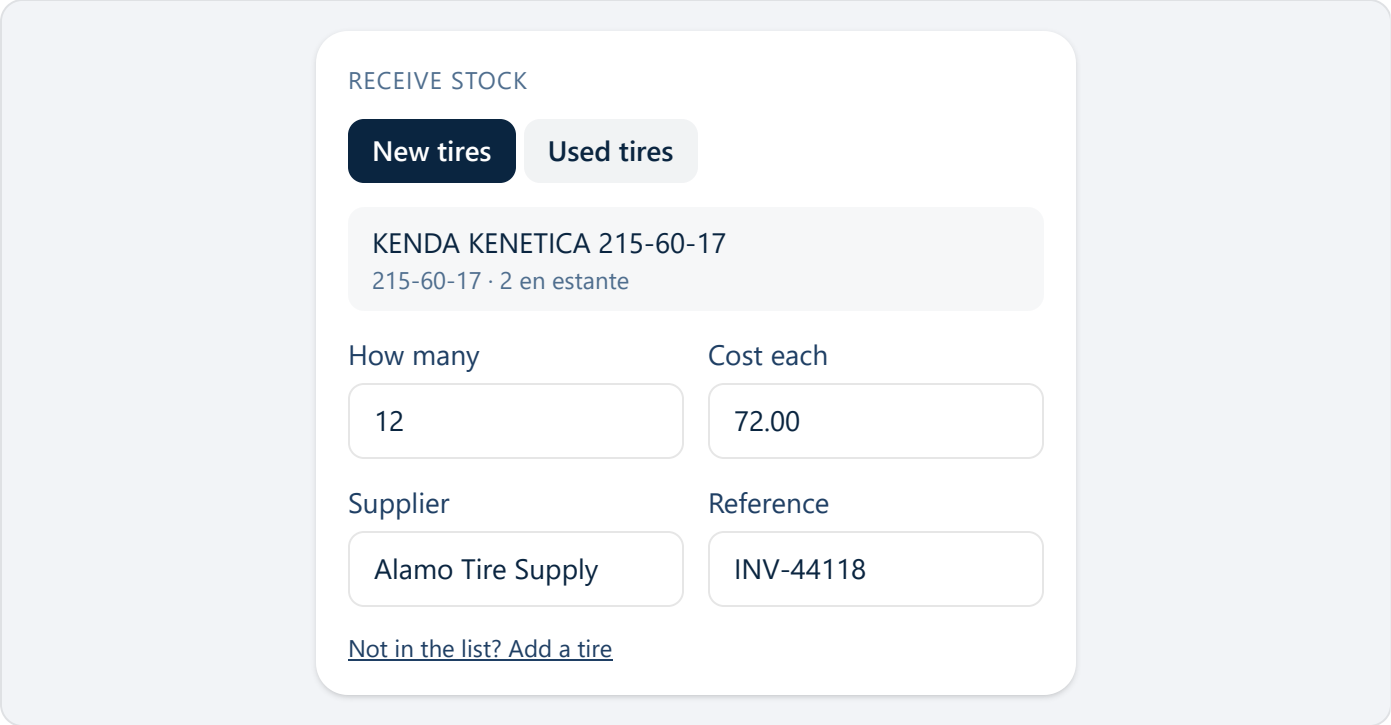

ALL THREE ARE FILED TOGETHER

Every sheet carries the shop, the date and who printed it at the top, precisely because they get separated in the filing cabinet. If you find a loose page, it says which day it belongs to.

15 Putting new tires into stock

When the van arrives, the tires have to be **entered into the system**. If they are not, stock will say there are none while you are looking at them on the rack.

1. Open **Inventory**.
2. At the top, press **+ Receive stock**.
3. Pick the tab: **New tires** or **Used tires**.
4. Search the tire and tap it. It appears at the top so you can confirm you picked the right one.
5. Enter **how many** arrived and **what each cost**.
6. Enter the **supplier** and the **invoice number**.
7. Save.

WHAT JUST HAPPENED

Those tires are now on the rack as far as the system is concerned. If there were 2 and you entered 12, it now says 14 and they can be sold. It also recorded **what they cost** and **who from**, which is what lets the supplier's invoice be checked later.

ENTER THEM THE DAY THEY ARRIVE

Enter them three days later and for three days the system said there were none — somebody may have told a customer we did not have them, or sold one against a no-stock warning. It is the easiest mistake to avoid and the hardest to trace back.

A tire the shop has never carried

If you search and it is **not in the list**, that brand or size is new to the system. Inside the same **Receive stock** panel, at the bottom, there is a small link:

1. Press **Not in the list? Add a tire**.
2. Enter the **brand** (say GOODYEAR), the **model** (TRAVEZA) and the **size** (195-65-15) in their separate boxes.
3. Set the **selling price**.
4. Carry on with quantity and cost as usual, and save.

BRAND AND MODEL GO IN SEPARATE BOXES

Do not type *GOODYEAR TRAVEZA* into one box. They go in two, which is why there are two. Typed together, the search stops finding them properly and the same tire ends up created twice under two different names.

BEFORE CREATING ONE, SEARCH AGAIN

Search by **size** alone, without the brand. Very often it is there, just spelled differently. Creating one that already existed leaves two rows for the same tire, and from then on the count for that size is worthless.

16 When the tire is not there

A customer asks for a size and we do not have it. There are **three different situations** and each is handled differently. The first job is knowing which one you are in:

THE SITUATION	WHAT TO DO
We do have it, but the system says 0 — it is in front of you on the rack.	Sell it normally. The system warns there is no stock; carry on. Then tell a manager so the count gets straightened out.
We do not have it and the customer wants it — it has to be ordered.	In **New sale**, Inventory mode, press **Not on the rack? Order it in**.
It has arrived from the supplier and needs entering.	**Inventory** → **+ Receive stock**. See the previous section.

Ordering it in for the customer

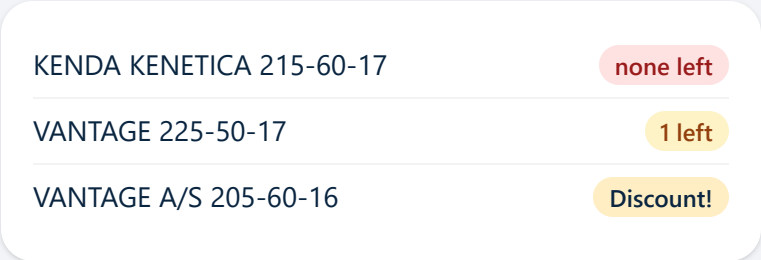

1. In **New sale**, switch to **Inventory** mode.
2. Press **Not on the rack? Order it in** — the small link under the search box.
3. Build the ticket with what they are having and take a deposit if there is one.

> **WHAT JUST HAPPENED**
>
> The ticket is marked as a **special order** and moved to the **amber** box on **Main**, with its status on *Ordered*. From there the status has to be moved along as things happen — see the orders section.

> **SELLING WITH NO STOCK IS NOT FORBIDDEN**
>
> If the tire is on the rack, **sell it**, whatever the system says. The warning is not a refusal: it is a note that the rack and the system disagree and somebody has to find out which is wrong. What is not acceptable is saying nothing.

17 Stock and its warnings

In **Inventory** each size carries a coloured tag saying how it stands:

TAG	WHAT IT MEANS
Red — *none left*	There are none. It needs ordering.
Amber — *N left*	Getting low. It also appears on the night's close-out.
Gold — *Discount!*	That size is flagged as discounted.

> **SELLING STOCK IT SAYS IS GONE**
>
> You can, and sometimes you must — the tire is on the rack even though the system says otherwise. It gets flagged, because it means the rack and the system disagree and somebody has to find out which is wrong. It is not a telling-off; it is a note.

18 When you got it wrong

Nothing is deleted here. Everything is corrected by **adding** the correction, and both stay visible. That is what makes it possible to explain a ticket a month later.

YOU GOT WRONG…	NOT CHARGED YET	ALREADY CHARGED
The price	**Change the price** — you can.	A manager corrects it from the ticket.
The quantity	**How many** — you can.	A manager.
The tender	Does not apply.	A manager. **Say so the same day.**
The whole ticket	Take the lines off it.	A manager voids it.

Where each thing gets fixed

Almost everybody gets stuck on the same thing: **not knowing where to go**. Here is the short answer.

THE MISTAKE	WHERE TO GO	WHAT TO PRESS
A wrong line, ticket still open	The sale screen you are on	Tap the line → **Change the price** or **How many**
A wrong line, ticket already charged	**Main** or **Logs** → tap the ticket number	In the drawer: **Fix a price that was rung wrong**
Wrong tender	**Logs** → tap the ticket	Correct the payment (manager)
Forgot the tip	**Logs** → tap the ticket	**Tip added later**
The whole ticket is wrong	**Logs** → tap the ticket	Void it (manager)
The rack count is wrong	**Inventory** → find the tire	**Count** on that row (manager)
A tire's price or name is wrong	**Inventory** → find the tire	**Edit** on that row (manager)

KENDA KENETICA 215-60-17	14	$150.00	Edit Count
VANTAGE 225-50-17	1	$130.00	Edit Count

> **EDIT AND COUNT ARE DIFFERENT**
>
> **Edit** changes what the tire *is* — its name, its size, its price. **Count** changes **how many there are**, and asks for a reason: miscount, damaged, sold off the books. If the number is wrong it is Count; if the name or price is wrong it is Edit.

Voiding is not refunding

Void = this ticket should never have existed. The money goes back and **the tires return to the racks**.

Refund = the sale did happen, but the customer brought the tire back later. The sale stays; the return is recorded separately.

> **THE WORST THING YOU CAN DO**
>
> Trying to fix a mistake by ringing an opposite ticket, or overcharging elsewhere to make it balance. Everything has a proper correction and all of them leave a record. Ask before inventing one.

19 Tips

A tip is recorded **against the payment**, not the ticket. That sounds like a detail and is not: it means a tip can be added **later**, even the next day, and it still reaches the right technician.

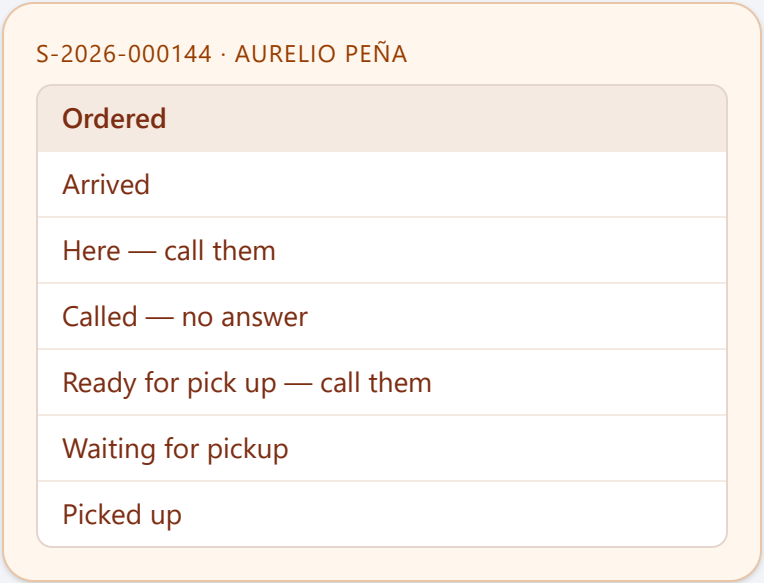

> **YOU FORGOT THE TIP**
>
> Do not ring another ticket. Open the original and add the tip to its payment. **Never** ring a tip as a sale: that puts money into the day's sales that was not a sale, and the count will not come out at night.

The terminal's charge is worked out automatically from the shop's rule. There is no arithmetic to do by hand and nothing to round.

20 Ordering a tire in

When the size is not on the racks, ring the ticket as normal, take a deposit if there is one, and send the ticket to wait. That is when it appears in the **amber** box on **Main**.

Every waiting ticket carries a status. It is changed from that same box, and the statuses run in this order:

STATUS	WHAT IT MEANS
Ordered	Ordered from the supplier.
Arrived	It has arrived at the shop.
Here — call them	It is here and **the customer has not been called**.
Called — no answer	Called, no answer. Somebody has to try again.
Ready for pick up — call them	Fitted or ready to hand over.
Waiting for pickup	The customer knows and is coming.
Picked up	Collected. **It leaves the list.**

THE STATUS IS THE ONLY THING THAT REMEMBERS FOR YOU

Nobody is going to remember on Thursday that the tire arrived on Tuesday. Whoever opens up reads that box and makes the day's calls — and can only make the ones the status tells them about. A ticket stuck on *Ordered* for three weeks is a customer nobody rang back. **Move it the moment anything happens**, even if it is only to say there was no answer.

21 When the ordered tire arrives

When an order is marked delivered, a box opens and asks **one question**: was this tire already put into the stock count when it arrived?

It has to ask, because in the database the two look identical. A tire that arrived and was booked in with **Receive stock** is exactly the same row as a tire that arrived for an order. The computer cannot tell them apart. You can — you were holding it.

What the box shows you

Every tire on the ticket, with **how many the count says are on hand** right now.

Every movement that tire has had: when it came in, when it went out, who and on which ticket.

An amber tag reading **added by hand** on any receipt with no ticket against it. That one is very probably the one you are looking for.

1. **Tick** only the tires that were already put into stock.
2. Read the line at the bottom. It says in plain words what is about to happen.
3. Tick **I'm sure** and press **Fulfil the order**.

> **THE TWO WRONG ANSWERS FAIL IN OPPOSITE DIRECTIONS**
>
> Tick one that was **not** booked in and that size ends up one **low**. Fail to tick one that **was** and it ends up one **high** — which is worse, because the system will tell you there is a tire that is not there and somebody will promise it to a customer. Neither fixes itself. That is why there is an **I'm sure** tick.

> **IF YOU ARE NOT SURE, DO NOT GUESS**
>
> Cancel, go and count that size on the rack, and come back. It costs two minutes. Guessing can cost weeks of a wrong number nobody can find.

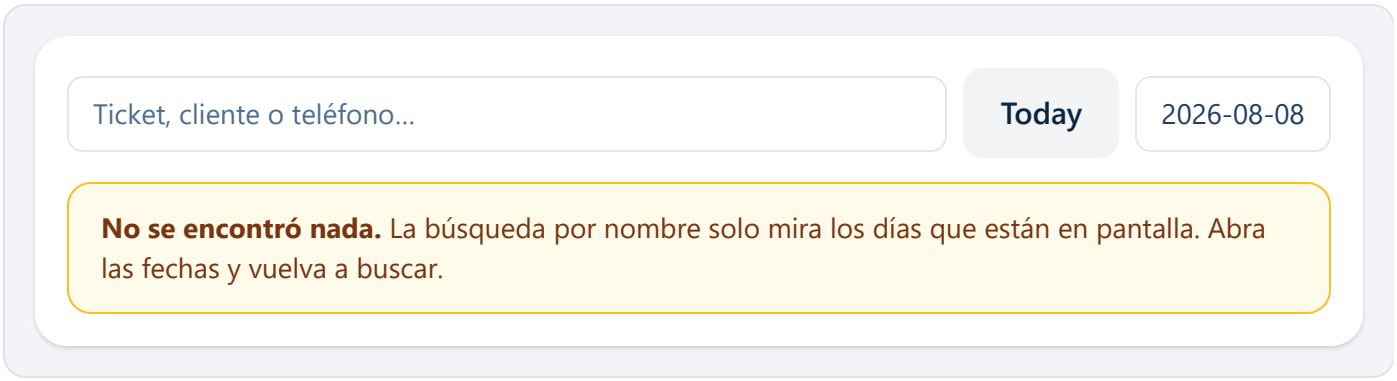

22 Finding an old ticket

Everything is in **Logs**. There are three ways to search:

By **ticket number** — for example *145*, you do not need the whole thing.

By **customer name** or **phone**.

By **date**. The second date picker opens a range, to search between two days.

IF A NAME FINDS NOTHING

It is nearly always this: **the search only looks at the days on screen**. If the ticket is a month old and the screen says today, it will not be found even with the name spelled correctly. Widen the dates first, then search. The system shows that amber box for exactly this reason.

23 What Logs hides, and what it paints red

Logs is the list of everything that happened, row by row, in the order it happened. But not everything that happened is worth reading twice, and the screen sorts it into three.

The little eye

To the left of the **Today** button there is a **little eye**. When it has a line through it — which is how the screen always opens — the list is **hiding the lines that were rung and struck off the same ticket**.

That is not hiding anything: a line somebody typed wrong and corrected ten seconds later **is not an event of the day** — it is somebody using the register. On a busy afternoon they were half the list, and the rows that matter got lost among them. Press the eye and they all come back.

Voided tickets come out red

A **voided ticket** is a different thing entirely: it is a job that did not happen. Those are **never** hidden, and they now come out with the row tinted **light red** rather than merely struck through. When the drawer is short at night a void is the commonest explanation there is — the list has to show it to you from across the screen.

The **Show voided** tickbox is still there and still yours. The eye and that box are **not the same switch**: the eye is about single lines, the box is about whole tickets.

> **THE OWNER CAN TAKE A ROW OFF THE LIST**
>
> Only the owner, and only on rows that are already dead — a voided ticket, a struck line, a payment that has been reversed. It is for clearing away test tickets and corrections that no longer tell anybody anything. **It moves no money**: if the row still carries live money the system refuses and says why. And nothing is destroyed — the owner still sees it in red with a **deleted** tag on it, and can put it back with one press.

24 The customer book

From **Logs**, the **Customers** button opens the customer book: everybody who has ever left a name. The list is on the left, and pressing a name opens everything about them on the right.

Their cars — year, make, model, colour, plate and tire size.

Every ticket of theirs, newest first. Press one and it opens.

A pinned note, exactly like the one on **Main**: anybody writes it and everybody sees it.

The three tickboxes

BOX	WHAT IT LEAVES ON THE LIST
Owes money	Only the people who still owe on a ticket.
Credit account	Only the people running a tab with the shop, and of those only their account tickets.
Not approved	The people running a tab that **nobody approved for credit**. That is the short list that matters.

> **THE LITTLE STAR**
>
> A manager can mark a customer **Credit approved** from inside their card. From then on a **star** appears in front of their name on the list, and when they are picked on a new ticket a green box says *Store Credit Approved*. It is so the person at the counter does not have to go and ask.

A manager can **correct** the name, the phone and the cars, and can **delete a car** that has been sold on. Deleting the customer outright is the owner's only: their tickets keep their name, but they stop existing for anybody looking them up.

25 House accounts

Some customers do not pay at the counter: it goes on the tab and they settle at the end of the month. That is rung against the **Credit Account** tender, and the ticket reads **paid** — the drawer balances at night, because as far as the till is concerned that money is no longer pending.

> **A HOUSE ACCOUNT IS NOT AN UNPAID TICKET**
>
> An **unpaid ticket** is settled at the register, sits in the box on **Main**, and is chased by whoever is at the counter. A **house account** is not: it builds up over weeks, is paid against the total rather than against any one ticket, and is handled by one person who is not on the floor. They are two different things and they do not mix.

Who can touch it

The **owner** and the **accountant**, and nobody else. A manager runs the floor and has no part in what somebody owes over a month.

Recording a payment

1. Open the customer and press **Record a payment**.
2. **How much** came in.
3. **When it was paid** — not when you are typing it. A cheque dated the 3rd that reached the desk on the 11th is the 3rd's money.
4. **How** — *Cheque 4471*, *cash in person*, *card over the phone*.
5. **To what account** — *Frost checking*, *the register*.

> **IF IT WENT ON THE WRONG CUSTOMER**
>
> Press **Show payments**, find the row and press **Void**. It is not erased: its opposite is written. The wrong payment stays as the record that it was made, because the account it wrongly credited **really did read low** until somebody noticed, and a trail that erases that is worth less than no trail.

What went on the tab

Under the balance is the list of tickets that went on the tab. Charges that **cancelled themselves out** — a voided ticket, or a sale rung to the account and then corrected to the card the customer actually used — are **hidden**, because they are a charge and its opposite that net to nothing. The small *show 2 cancelled* link brings them back.

On paper they **never** appear, whichever way that link is left. A statement that hands the customer a $210 charge and a −$210 beside it has handed them arithmetic to do before they can read what they owe.

The statement

Print statement produces that customer's sheet: the shop's letterhead, their name, the balance, what went on and every payment. It comes out whole even when the payments are folded away on screen.

The whole month

The **Accounts this month** button, next to **← Logs**, opens the month's sheet: **one line per account, with four columns**.

COLUMN	WHAT IT IS
Owed at the 1st	What they owed before the month started.
Went on	What went onto the tab during the month.
Came in	What they paid during the month.
Owed at the end	What they owe now.

> **THE FOUR COLUMNS CHECK EACH OTHER**
>
> The first plus the second less the third **must** equal the fourth, on every line and on the total at the foot. That is why there are four and not one: a list of balances cannot be checked against anything. If it ever fails to add up the sheet says so in red, and it should not be filed until somebody has looked.

Below it is the list of **every payment in the month** — date, customer, how, to what account and who recorded it. At the top there is a month picker and a **Print** button.

26 The month's tire sheets

From **Logs**, the **Tire movements** button opens the record of everything that has come in and out of the racks. At the top of that screen are two buttons that produce the two sheets asked for every month.

BUTTON	WHAT IT GIVES YOU
Sold this month	Every **new tire sold** in the month, with the total and with the tax backed out.
Stocked this month	Every **new tire booked in**, with what was paid for them and the tax backed out.

Both carry a **pill** on each row saying whether that tire was **for a customer's order** or **off the rack**, with a summary at the foot that counts them. Pressing a button turns it blue and folds away the long log underneath, so the sheet prints on its own. Press it again and it comes back.

> **THE SHEET IS ONLY AS GOOD AS THE COSTS TYPED IN**
>
> The stocked sheet adds up the costs somebody typed when receiving. If a cost was entered wrong the total is wrong, and the sheet has no way to know. That is what the amber box above the summary is for.

27 The Performance board on the close-out

On the **Close-out**, the line reading **HOW THE WEEK IS GOING** opens the two charts and the technicians' board. It comes shut on purpose: the close-out is a sequence — count, log, settle, sign — and neither of those is a step in it. They are for reading once the money is away.

Inside there is a picker with four ways to read it:

OPTION	COMPARES THE WORK AGAINST…	AND THE TIPS COLUMN SHOWS…
Default	Last week.	**Today's** tips. This is exactly what prints.
By day	The **last day that technician was in**, not yesterday.	Today's against that day's.
By week	Last week.	This week's against last week's.
By month	The same days of last month.	This month's against last month's.

> **WHY **BY DAY** DOES NOT COMPARE AGAINST YESTERDAY**
>
> Because not everybody is in every day. Measured against yesterday, anyone who was off shows red at −100% beside the people who were there — which says nothing about them except which days they had off. Each person is measured against **their own** last shift, which is the question that can actually be answered.

> **THE PICKER DOES NOT CHANGE THE PAPER**
>
> The printed sheet **always** comes out on Default — the week, with today's tips — whatever the picker says. A close-out is filed and compared against other close-outs: a column that said *this month* on one night and *today* on another would make the whole stack unreadable. And on paper that column answers *what is going home in whose pocket tonight*, which is not a weekly total.

28 The wall board

The screen hung where the floor can see it. No PIN, refreshes itself every half minute, and there is nothing on it to press.

Top: who is ahead, in whichever category is selected.

Bottom left: today's tips.

Bottom right: the last tickets rung.

> **WHY TIPS SHOW AS A SHARE**
>
> Because customers can see that screen too, and a customer who learns what the technicians made in tips today may well decide to keep his five dollars. **Show the dollars** puts the amounts up for **one minute** and takes them down by itself — deliberately, because the failure of that button is pressing it and walking off.

A tipped ticket carries a **gold edge** and the amount in a gold badge, so it reads from the far side of the shop.

29 Who can do what

Each person sees only what belongs to them. If a tab or a button is not there, **nothing is broken**: your role does not have it.

CAN…	TECHNICIAN	WRITER	CASHIER	ACCOUNTANT	MANAGER
See stock and prices	**Yes**	**Yes**	**Yes**	**Yes**	**Yes**
Ring tickets and take money	No	**Yes**	**Yes**	**Yes**	**Yes**
See Main	No	**Yes**	**Yes**	**Yes**	**Yes**
See Logs	No	No	**Yes**	**Yes**	**Yes**
Run the close-out	No	No	**Yes**	**Yes**	**Yes**
Void and refund	No	No	No	No	**Yes**
Correct a payment already taken	No	No	No	No	**Yes**
Receive stock	No	No	No	No	**Yes**
Take cash out of the drawer	No	No	No	No	**Yes**
Correct customers and their cars	No	No	No	**Yes**	**Yes**
See and settle house accounts	No	No	No	**Yes**	No

THE ACCOUNTANT

The one role that is **not** a rung on the ladder. On the floor it is worth exactly what a cashier is worth — rings tickets, takes money, runs the close-out — and in the customer tab it can do everything the owner can. It cannot void tickets or receive stock, because neither is its job. That is deliberate: **house-account money is touched by two people and no more**, the accountant and the owner.

ABOVE MANAGER

A few things only the owner can do — costs, pay, adding people and the system settings. They are deliberately not in this manual: if you need one of them, it is because it has to be asked for.

IF YOU NEED SOMETHING THAT IS NOT THERE

Ask a manager. Do not ask anybody to lend you their sign-in — see section 1.

30 Common problems

IF THIS HAPPENS…	DO THIS
The screen is stuck or looks wrong	Hold **Ctrl** and **Shift** and press **R**. It reloads without losing anything.
It will not take my PIN	Check you tapped your name **first**. That is the usual mistake.
A tab is missing	Your role does not have it. See the permissions section.
I took money on the wrong tender	Tell a manager **today**. It is corrected from the ticket.
I charged the wrong amount	If the ticket is not closed yet, fix it yourself. If it is closed, a manager.
The power went out	Switch on and sign in as normal. Tickets already taken are not lost.
The receipt prints cut off	In the print dialog: paper **Letter**, scale **100%**.
I do not know what I just pressed	If a box appeared, press the **grey** button. That one never does anything.

31 Words worth knowing

If a word on the screen does not mean anything to you, it is here:

WORD	WHAT IT MEANS HERE
Sold	What we charged for today's work.
Collected	The money that came in today.
Pending	Work done that nobody has paid for.
Outstanding	A ticket waiting on something — a tire or a customer.
Tender	The way something was paid.
Void	The ticket should never have existed.
Refund	The sale happened, and was returned afterwards.
Balance due	What the customer still owes.
Expected	What the system works out should be there.
Counted	What you counted by hand.
Difference	The gap between those two.
Batch	The card terminal's batch, settled at night.
Credit Account / house account	A customer's running tab, settled at the end of the month. Not an unpaid ticket.
Statement	One account's sheet: balance, charges and payments.
Approved / Credit approved	That a manager did agree to carry this customer on a tab. A star appears by their name.
Audited	That somebody looked at **that one** charge and was satisfied. It does not approve the customer.
Fulfil	Close out an order: the tire is on the customer's car.

32 The three rules

If nothing else here stays with you, keep these three.

1. **The grey button never does anything.** When a box appears and you are not sure, press the grey one. You can always start again.
2. **Write down what actually happened.** Never tidy a number to make it balance. The system copes with a mistake; it does not cope with a hidden one.
3. **Say so the same day.** Almost everything is easy to correct today and a problem in a fortnight.

33 Company accounts (fleets)

A **company** is a customer whose account several drivers charge to. Williams Insulation is a company; its drivers come in with company trucks and what they spend goes on the Williams account, not on their own. A driver with his own credit who works for nobody stays exactly as he is — none of this changes him.

> **THE RULE, IN ONE LINE**
>
> **If a customer is assigned to a company, everything they put on account belongs to the company.** That is why there is nothing to choose when you take payment: it is chosen once, when the driver is set up. A driver who must be billed separately is simply not assigned to a company.

Step 1 · Mark the company

1. Go to **Customers** and find the company — say *Williams Insulation*. If it does not exist yet (like *Carrillo Construction*), press **New customer** and create it first, under the company's name.
2. With the company open, tick **This is a company others can be billed to**.
3. Make sure **Store credit approved** is ticked as well. That is what says the shop carries that company.

> **WHAT JUST HAPPENED**
>
> That company now appears in the **Billed to** list on every screen where a customer is set up. No balance has changed yet — it is simply ready to take drivers.

Step 2 · Add the driver

There are two ways in and they leave the same result. Use whichever is in front of you at the time.

1. **From the customer book.** **Customers** → **New customer**. Type the driver's name and phone, and under **Billed to** pick the company. Press **Add them**.
2. **From a sale.** Ring it as normal: put the driver's name and truck on the ticket, and when you choose **Credit Account** a blue box appears saying **Billed to**. Pick the company there. It is remembered for good — you do not do it again next month.

WHAT JUST HAPPENED

The driver is now **assigned to the company**. From that moment every account charge of his adds to the company's balance — and the ticket **still carries the driver's name and his truck**, which is what later lets you tell the company exactly who spent what.

THE TRUCK COMES WITH HIM

A vehicle captured on the driver's ticket also shows on the company's sheet. There is no second place to enter it and nothing to register separately.

Step 3 · Ring it as normal

There is no new step when taking payment. Put the driver on the ticket, choose **Credit Account**, and that is it. The charge goes to the company's account on its own.

THE DRIVER'S BALANCE IS NOT HIS ANY MORE

If you look the driver up in **Customers**, his row says which company he is billed to and **shows no separate balance** — because he has none. The money lives on the company. If somebody asks "how much does this driver owe", the honest answer is how much he has put on the company's account, and that is on the company's sheet, line by line.

Step 4 · The company's sheet

1. **Customers** → find the company → press **Statement** →.
2. Pick the month at the top right and press **Print**.

The sheet carries four figures that reconcile — **owed at the start, charged, paid, owed now** — and under them every charge with its date, ticket, **driver** and truck. A charge rung on the company itself says *on the account* where a driver's name would be.

WHAT THE DRIVER COLUMN IS FOR

It is the difference between sending a number and sending a document. A company that receives "$4,200 for March" has to take it on trust; one that receives the list with driver, truck and ticket can check it against their own records. An argument about a charge becomes a five-minute lookup.

Things you will need

SITUATION	WHAT TO DO
The driver moved companies	Open him in **Customers** and change **Billed to**. The past does NOT move: what he already charged to the old company stays theirs, because that is what happened.
The driver leaves and now pays himself	Change **Billed to** to *Themselves*, and tick his own **Store credit approved** if he is to be carried.
The company's owner comes in his own car	If his personal record is assigned to the company, that charge is the company's too. To keep them apart, make two customers: the person and the company.
The company pays	Take it against the **company's** account, like any other payment. It brings down the balance for all its drivers at once, because it is one balance.

> **A COMPANY CANNOT SIT INSIDE ANOTHER**
>
> The system refuses it, on purpose. One level — a company and its drivers — is what keeps a balance unambiguous. If it is genuinely needed, raise it before inventing a workaround.
