STAFF MANUAL

Time Clock

Punching in and out, correcting hours, and the admin side

Casias Muffler and Tire Shop · San Antonio, Texas
For all staff · August 2026

HOW TO READ THIS

A box like **Check In** is the exact text on a button. The grey slabs are **pieces of the screen**, not controls on this page. The first five sections are for everybody; from there on it is the admin side, opened with a password.

Contents

01 The clock screen

02 Punching

03 Breaks

04 If you forgot to punch

05 The links at the bottom

06 Admin — what is in it

07 Employees

09 Hours reports

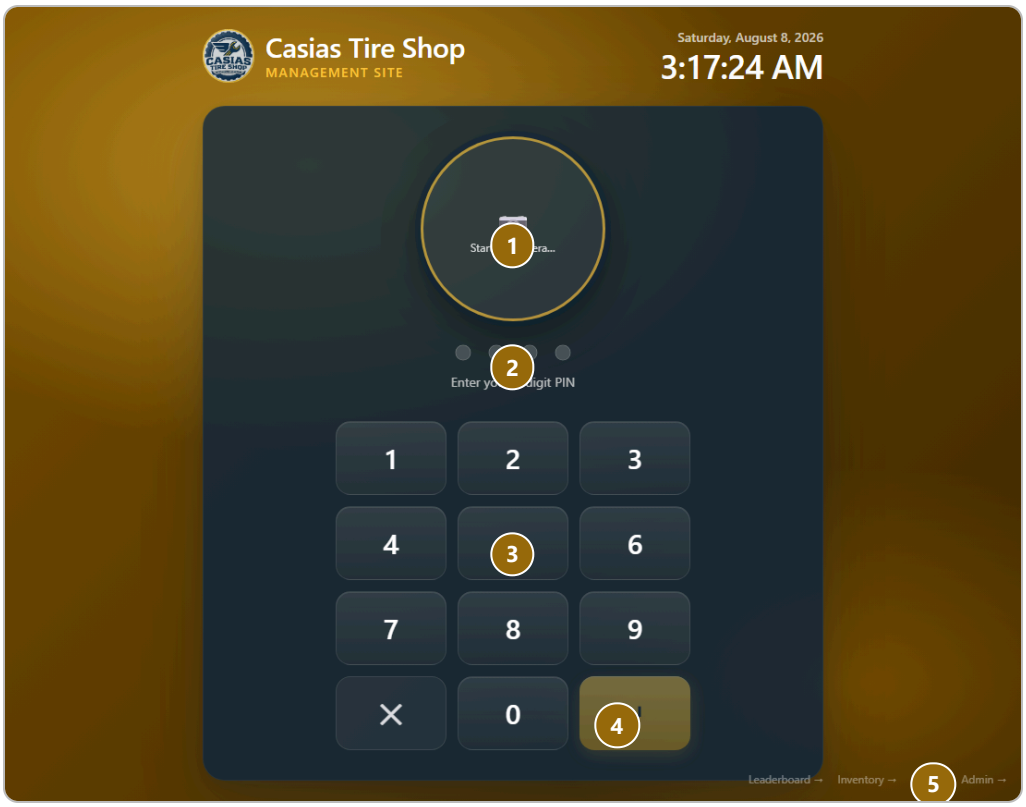

10 Settings

11 The audit log

12 Common problems

01 The clock screen

The dark screen with the big clock on it. It is on all day and there is nothing to open: it is always ready.

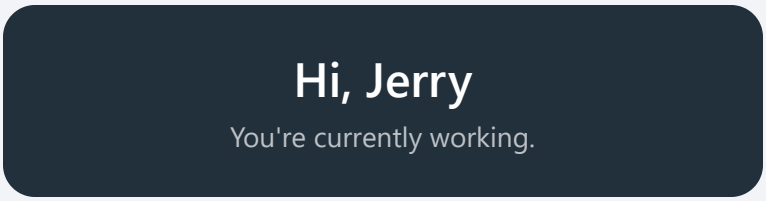

1. **The camera.** You see yourself. The photo is taken automatically.
2. **The four dots.** They fill as you type the PIN.
3. **The keypad.** The digits.
4. **The ↵ key.** It lights up once all four are in.
5. **The links.** Board, stock, this manual and Admin.

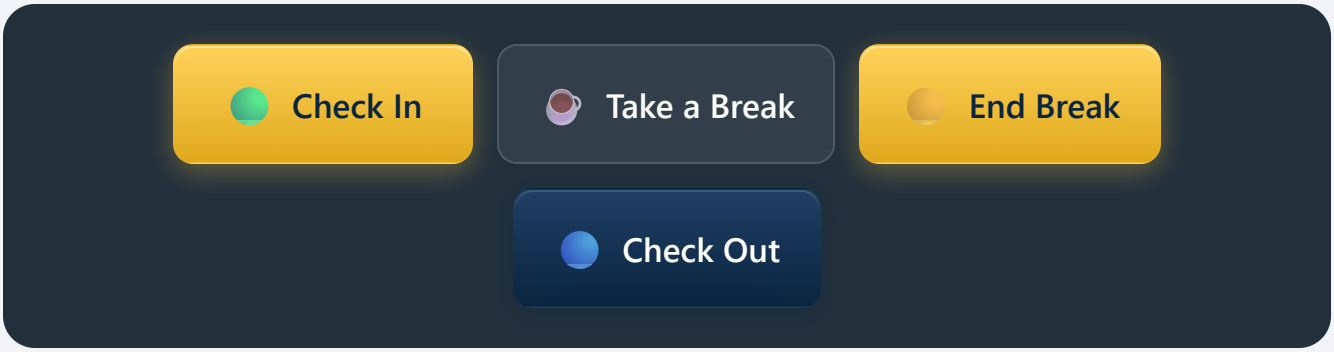

> **THERE IS NO NAME TO PICK**
>
> Unlike the register, there is **no list of names** here. The PIN alone says who you are. Type it and that is all.

02 Punching

1. Type your four-digit **PIN**.
2. Press the ↵ key.
3. The clock answers with your name and says where you stand:

Under the greeting come the buttons — **only the ones you can use right now**:

BUTTON	WHEN IT APPEARS	WHAT IT DOES
Check In	When you are out.	Starts your day.
Take a Break	When you are working.	Starts a break.
End Break	When you are on a break.	Puts you back to work.
Check Out	When you are working.	Ends your day.

> **WHAT JUST HAPPENED**
>
> The exact time was saved, with your name and your photo. **You cannot punch the same thing twice**: if you are already in, the check-in button is not even there. That is why there is no wrong button to press.

A PHOTO IS TAKEN EVERY TIME

It is not there to watch anybody. It is so that the day two people share a PIN, or somebody punches for a workmate, it shows. The photos delete themselves after a while.

03 Breaks

Punched the same way: PIN, ↵, then 🟣 **Take a Break**. Coming back: PIN, ↵, and 🟡 **End Break**.

> **IF YOU FORGET TO END A BREAK**
>
> Do **not** fix it by punching out and back in. That leaves the day in pieces nobody can read afterwards. Tell the owner: it is corrected in Admin under **Time Entries**, with a note saying why.

04 If you forgot to punch

It happens, and it is fixable. The only thing that matters is saying so **the same day**, while somebody still remembers the real time.

Do not punch a made-up time to even it out. Who punched and when is recorded, and it looks worse than the mistake.

Tell the owner. They correct it, and the correction is recorded under **their** name, not yours.

> **THE CLOCK CLOSES ITSELF AT NIGHT**
>
> If somebody leaves without clocking out, the system closes their day at the shop's closing hour. That stops twenty-hour shifts appearing in the report — but the time written is the closing hour, **not when you actually left**. If it happened to you, say so, or you will be paid wrong.

05 The links at the bottom

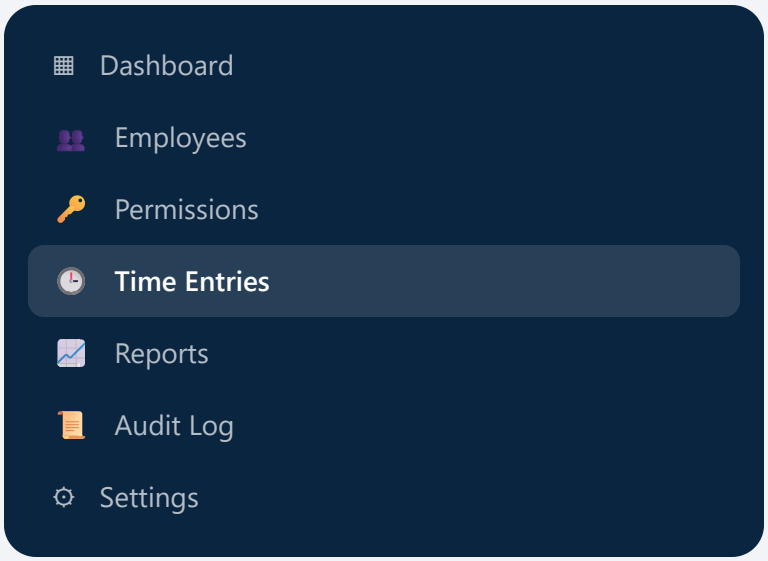

Bottom right there are four small links. Three ask for nothing; the last one does.

LINK	WHAT IT OPENS	ASKS FOR A PASSWORD
Leaderboard	The wall board.	No
Inventory	What tires are on the racks.	No
Help	This manual.	No
Admin	The clock's admin side.	**Yes**

> **WHY THOSE THREE ARE OPEN**
>
> Because behind a password nobody would use them. Whether we have a 215 55 17 gets asked twenty times a day, usually by somebody with their hands full, and the answer that gets used is the one you can get without stopping. None of the three shows costs or anybody's pay.

06 Admin — what is in it

Admin is the clock's management side. It takes a **username and password**, not a PIN — a different door on purpose. The menu is down the left:

SECTION	WHAT YOU DO THERE
▦ Dashboard	Who is in right now and how the week is going. The screen you land on.
👥 Employees	Add people, change PINs, grant register access, deactivate.
🔑 Permissions	What each level can do and who has which.
🕒 Time Entries	See and correct clock punches.
📈 Reports	Weekly hours by employee.
📜 Audit Log	Everything that changed, by whom and when.
⚙ Settings	Shop settings and the Admin password.

07 Employees

Adding somebody

1. Open **Employees** and add the employee.
2. Name and title — for example *Tech* or *Front Desk*.
3. A **four-digit PIN**. That is what they punch with.
4. If they will also use the register, switch on **POS access** and pick their role.

> **WHAT JUST HAPPENED**
>
> That person can now punch the clock with their PIN. If you gave them **POS access**, they can also sign into the register — and there their name does appear in the list.

> **NEVER DELETE AN EMPLOYEE**
>
> Deactivate them by changing their status. Deleting would take **their hours and their tickets** with them, and those are the shop's record, not the employee's. Deactivated, they can no longer punch or sign in, and everything they did stays.

Changing a PIN

From the employee's record. Do it the day anybody suspects somebody else has learned it: the PIN is what puts a name on every punch and every ticket, so a borrowed PIN is a record that no longer proves anything.

08 Correcting hours

Time Entries holds every punch: check in, check out, break start and break end — each with its time, its photo and its notes.

1. Find the day and the employee.
2. Correct the time that is wrong.
3. **Write a note** saying why. This is the part that matters.

> **THE NOTE IS NOT PAPERWORK**
>
> A time changed with no reason looks **exactly like** a time changed for convenience, and in three months nobody will tell them apart — including you. The note is the only thing that turns a correction into a record.

> **WHAT JUST HAPPENED**
>
> The time is corrected and the change is written into **Audit Log** with your name and when you did it. The original punch is not deleted: the before and the after both stay.

09 Hours reports

Reports gives the week's hours: **worked**, **on break**, and the day-by-day breakdown. One person or everybody.

> **THE WEEK STARTS WHEN YOU SAY**
>
> **Settings** is where the week's first day is chosen. **Set it to match how you pay.** If the report starts on Sunday and you pay Monday to Monday, the totals will never line up with payroll and it will look as though the clock is wrong.

10 Settings

What **Settings** changes and why it matters:

SETTING	WHAT IT DOES	GET IT WRONG AND
Name, address, phone	What prints on receipts.	Receipts go out with stale details.
Week start day	How hours are grouped.	The report will not match payroll.
Auto-close hour	When anybody who did not clock out is closed.	Enormous shifts, or people closed too early.
Break auto-deduct	Minutes taken off automatically. At zero, nothing.	Everybody is paid wrong, every day.
Photo retention	How long the clock's photos are kept.	The disk fills, or they go before they are useful.
Admin password	The password for this section.	Change it if anybody else learns it.

11 The audit log

Audit Log keeps **everything** that changed: what was done, to what, by whom and when. It cannot be deleted or edited, not even from inside it.

It is good for one thing, and that is enough: answering **"who changed this"** without it being one person's word against another's.

12 Common problems

IF THIS HAPPENS…	DO THIS
The clock will not take my PIN	Check it is four digits. If it still fails you may have been deactivated — tell the owner.
I punched and nothing happened	If the greeting with your name did not appear, you **did not punch**. Try again.
The check-in button is not there	Because you are already in. The clock only offers what applies.
I forgot to clock out	The system closed your day at the closing hour. Tell the owner the real time.
The camera does not start	The punch is saved anyway. Let the owner know.
Somebody left the shop	Deactivate them in **Employees**. **Never delete them.**
Hours do not match payroll	Check the week start day in **Settings**.
